

ANNOTATED Black Bear Hibernation Task

Annotation Key

Criteria 1	Criteria 2 (3 Dimensions)			Criteria 3	Criteria 4	
Phenomena Information provided to elicit performances	SEPs Opportunities to demonstrate science and engineering practices	DCIs Opportunities to demonstrate understanding of disciplinary core ideas	CCCs Opportunities to demonstrate understanding of crosscutting concepts	Sense-making Opportunities to use all 3 dimensions to reason about phenomena	Equity Supports a wide range of diverse students	Assessment Purpose Highlights how the task features connect to intended assessment use

Overview

This task is intended to be a summative transfer task at the end of the Metabolic Reactions unit.

This task includes [a key](#) with what to look for in student responses and a rubric for evaluating students' models in [question two](#).

Target PE

MS-LS1-7: Develop a model to describe how food is rearranged through chemical reactions forming new molecules that support growth and/or release energy as this matter moves through an organism.

Summary of Task Overall

Strengths	Opportunities for Improvement
<p>Students are using the three dimensions to make sense of how a bear could possibly survive the winter (phenomenon). Phenomena Sense-making</p> <p>Students need to apply their understanding of grade-level DCIs, SEPs, and CCCs to respond to each prompt. SEPs CCCs DCIs</p> <p>The task elicits artifacts of student thinking that are clearly connected to the purpose of the assessment. The key and modeling rubric provide supports for teachers to see key aspects of students' sense-making (summative, transfer task aligned to MS-LS1-7) Assessment Purpose Sense-making</p> <p>The scenario is likely to be engaging to students, most of whom probably have heard of or thought about hibernation in bears. It is also described in accessible language that is easy to understand. Even the data table has some built in supports. Phenomena Equity</p>	<p>Students might not bring CCCs to the task especially if they haven't been explicitly discussed and used in class. The task could explicitly call out CCCs for students to use in the prompts. E.g. Q3: Use your model and ideas about the flow of energy and matter to explain... CCCs</p> <p>Students don't have a lot of choice in how they show their thinking for each prompt. Teachers could give students options to write, draw, or talk about their understanding. Equity</p> <p>There is scaffolding for students to complete the model. Depending on students' needs the other questions might benefit from additional scaffolding to help students put together all the pieces they need to respond to the prompts. Equity</p>

Item	Annotation																								
<p>Each winter black bears in North America spend an average of 5 months inside of dens in a low activity state known as hibernation. During this time, they experience drastic body changes. They also do not eat, drink, defecate (poop), or urinate (pee) during this time. It is a wonder that the bears can survive each winter in this state without performing these essential body functions!</p>   <p>Above: This is bear 409, nicknamed “Beadnose,” from Katmai National Park in Alaska. The first picture was taken on June 29, and the second picture was taken on September 30.</p> <table border="1" data-bbox="168 1346 782 1648"> <thead> <tr> <th>Average Stats for an Adult Male Black Bear</th> <th>Fall - October Going into Hibernation</th> <th>Winter During Hibernation</th> <th>March - May Coming out of Hibernation</th> </tr> </thead> <tbody> <tr> <td>Body Temperature</td> <td>100°–101°F</td> <td>about 88° degrees F</td> <td>100°–101°F</td> </tr> <tr> <td>Breathing Rate & Heart Rate <i>One way to measure energy used.</i></td> <td>Normal</td> <td>Very Slow</td> <td>Normal</td> </tr> <tr> <td>Heart Rate</td> <td>40-50 beats per min</td> <td>8-19 beats per min</td> <td>40-50 beats per min</td> </tr> <tr> <td>Weight</td> <td>about 450 pounds</td> <td>Not measured</td> <td>about 250 pounds</td> </tr> <tr> <td>Body Fat Percentage <i>Similar to DEXA scans—one way to measure how much fat the bear has stored.</i></td> <td>30%</td> <td>Not measured</td> <td>15%</td> </tr> </tbody> </table>	Average Stats for an Adult Male Black Bear	Fall - October Going into Hibernation	Winter During Hibernation	March - May Coming out of Hibernation	Body Temperature	100°–101°F	about 88° degrees F	100°–101°F	Breathing Rate & Heart Rate <i>One way to measure energy used.</i>	Normal	Very Slow	Normal	Heart Rate	40-50 beats per min	8-19 beats per min	40-50 beats per min	Weight	about 450 pounds	Not measured	about 250 pounds	Body Fat Percentage <i>Similar to DEXA scans—one way to measure how much fat the bear has stored.</i>	30%	Not measured	15%	<p>The scenario includes a specific, real-world instance of bear hibernation with an example of a bear in Alaska. The phenomenon is set up to be comprehensible to a wide range of students, with limited words and sufficient detail to help students visualize what is going on. It creates a “need to know” setting up the motivation to understand how it is possible that the bears even survive when their bodies shut down like this. The scenario includes text, images, and a data table (3 modalities). The data is a well-crafted data set based on data from a variety of sources. The task is grade appropriate and explainable by grade level SEPs, CCCs, and DCIs.</p> <p>Phenomena Equity Sense-making</p>
Average Stats for an Adult Male Black Bear	Fall - October Going into Hibernation	Winter During Hibernation	March - May Coming out of Hibernation																						
Body Temperature	100°–101°F	about 88° degrees F	100°–101°F																						
Breathing Rate & Heart Rate <i>One way to measure energy used.</i>	Normal	Very Slow	Normal																						
Heart Rate	40-50 beats per min	8-19 beats per min	40-50 beats per min																						
Weight	about 450 pounds	Not measured	about 250 pounds																						
Body Fat Percentage <i>Similar to DEXA scans—one way to measure how much fat the bear has stored.</i>	30%	Not measured	15%																						

<p>Use the data above to explain this phenomenon.</p> <p>1. During hibernation, bears do not eat for 5 to 6 months in a row. How can the bear stay alive without eating for this long? Use patterns in the data table and science ideas developed throughout this unit to support your answer.</p> <hr/> <hr/> <hr/> <hr/>	<p>In their response to this prompt, students need to make claims about how the bear can survive for this long using patterns from the data table. This is appropriate for grade level constructing explanations where students are using science ideas and evidence to explain a real world phenomenon.</p> <p>Here, students use of the CCC Patterns is intertwined with the science ideas - they need to coordinate the idea with the data to support their claim. For example, Bears can use the stored fat and convert it to energy that their cells need through chemical reactions, which need oxygen, and then release carbon dioxide, water, and usable energy that cells can use. Evidence to support this claim includes the decrease in body fat percentage (bears are burning body fat) and decreased weight (probably related to the decrease in body fat).</p> <p>Sense-making SEPs CCCs DCIs</p>

<p>2. To prepare for winter in the den, a bear will gain up to 30 pounds a week (in extra mass) by eating grass, roots, berries, fish, insects, and small animals. Using everything you've learned from the unit, develop a model that explains, "How a bear can gain so much weight so quickly?" Some important components or interactions to include in your model are: food molecules, matter, energy, chemical reactions. Use extra sheets of paper if you run out of space.</p> <table border="0"> <tr> <td data-bbox="162 1470 454 1806"> <p>The components you should include in your model are:</p> <ul style="list-style-type: none"> ● Blood, cells ● fat stores ● Lungs ● Oxygen ● carbon dioxide ● bite of food ● food molecules. </td> <td data-bbox="470 1470 779 1806"> <p>Some interactions you should include in your model are:</p> <ul style="list-style-type: none"> ● Digestion, ● Absorption ● Eating, ● Excretion ● delivery to cells ● inhaling and exhaling </td> </tr> </table>	<p>The components you should include in your model are:</p> <ul style="list-style-type: none"> ● Blood, cells ● fat stores ● Lungs ● Oxygen ● carbon dioxide ● bite of food ● food molecules. 	<p>Some interactions you should include in your model are:</p> <ul style="list-style-type: none"> ● Digestion, ● Absorption ● Eating, ● Excretion ● delivery to cells ● inhaling and exhaling 	<p>In this version of the assessment, students are given ample support to create their model that explains how a bear can gain weight so quickly. Students need to bring their ideas about how these components and interactions work for bears to get and store the energy they need from matter (food molecules).</p> <p>The modeling is simplified; however, students still need to put the pieces together to describe the phenomenon. Students are using the three dimensions together to create this model.</p> <p>Sense-making SEPs CCCs DCIs Equity</p>

3. In spring, when the bears emerge from their dens, they have lost between 15% and 30% of their body weight (mass)—that could be around 120 pounds for a large black bear!

Using your model above, explain where all the mass went when it was “lost.”

Students need to use the model to trace the flow of matter to explain what happens to the mass that the bear loses.

Students need to bring a molecular level of understanding and explanation to this task. They can use their model of food molecules being processed by the body to do that.

It seems important that this question comes after the model and that they use the model and do not just say “matter can neither be created nor destroyed.”

When students use the DCIs to explain what’s going on they are applying their conceptual understanding not just telling about what they know.
